The River Basin Model Peter W. House,Environmetrics, Inc,1971 The River Basin Model which is a man-machine simulation model, used primarily to replicate the interactions taking place, within a real or hypothetical area, between the local water system and the full range of economic, social, and governmental activities of that area. It is a water resource model representing supply of, demand for, and quality of water, but it is also a labor market model, a land use and assessment model, and several more; it is a model of an entire regional system with water a subsystem realistically interacting with all the other major subsystems; the output from the operating programs of the computer package illustrate the impact that the water system has on such phenomena as housing selection, employment, and government budgetary activity. Model users are given control over all the resources of the local area being represented.

Florence and its University during the Early Renaissance Jonathan Davies, 2021-10-25 This book makes a substantial contribution to the study of Florentine history. It answers an important but hitherto unresolved question: why did the Florentine Republic keep a university in its capital city between 1385 and 1473 rather than follow the example of other Italian states in maintaining a university in a subject town? Based on a wide range of newly-found sources, it discloses that the University owed its survival to the support of the Florentine elite, especially the Medici family and its followers. It reveals systematically the close ties between the University and major developments in the social, economic, political, ecclesiastical, and cultural life of Florence and Florentine Tuscany. The appendices fill some of the greatest gaps in our knowledge of the University, identifying administrators, students, examiners, and teachers.
